New DNA fragment contg. protein encoding gene and yeast promoter -
controlled by mating pheromone allowing efficient and
regulatable expression.
Claim 5; Fig 4; 51pp; English.
FUS 1 promoter found within HIS4 gene may be used to promote at least one
polypeptide within a high-copy vector induced by a-factor for alpha cells
Sequence 512 AA;
                                                                                                                                                                                                                                                                           The ORF occurs between the BIK1 reading frame (on the complementary strand) and the FUS1 reading frame on chromosome III of S. cerevisiae. Transcription of the FUS1 gene is greatly enhanced by the presence of the appropriate mating pheromone. The promoter region can be used for the pheromone inducible expression of proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         03-FEB-1992 (first entry)
FUS1 protein.
Pheromone inducible yeast promoter; bilateral karyogamy defect;
FUS2; BIK1.
                                                                                                                                                                                                DNA fragment contg. pheromone-inducible yeast promoter - useful for transforming yeast cells to produce foreign proteins, which may be toxic to yeast cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel DNA encoding triol poly-ketide synthase - used to isolate and identify homologues of triol poly-ketide synthase, and in the treatment of hyper-chotseterolaemia and in the treatment of hyper-chotseterolaemia and proper-chotseterolaemia contained by the full-length TPKS-encoding DNA in plasmid pLOA was designated prFKS100. Splicing of the introns from the DNA sequence and translation of the 9114 nt OFF results in a protein of 3038 AAS (R74171) with a mol. wt. of 269,090 caltons. Inspection of the TPKS AA sequence for active site residues and motifs known to be associated with polyketide synthases and fatty acid synthase (FAS) activities resulted in the identification of candidates for expected rates for expected sites (see FT). Except for the presence of a methyl transferase, not present in FAS, the succession of activities on the TPKS protein is the same as that observed for the rat FAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

identifying calcium channel agonists and antagonists and diagnosing Lambert Eaton syndrome
Disclosure; Page 120-128; 150pp; English.

DNA encoding the alpha 1B subunit was isolated by screening a buna basal ganglia cDNA library with fragments of the rabbit skeletal muscle calcium channel alpha 1 subunit-encoding cDNA.

A portion of one of the positive clones was used to screen an IMR32 cell cDNA library. Clones that hybridized to the basal ganglia non A portion of one of further screen an IMR32 cell cDNA library. In this way, a sufficient series of human hippocampus cDNA library. In this way, a sufficient series of clones to span nearly the entire length of the nucleotide sequence clones to span nearly the entire length of the nucleotide sequence clones to span nearly the entire length of the nucleotide sequence of specific regions of the IMR32 cell alpha 1B mRNA yielded additional segments of the alpha 1B cooling sequence. A full-length alpha 1B DNA clone was constructed by ligating portions of the alpha 1B colling of the alpha 1B subunit
                                           30-JUN-1993 (first entry)
Sequence of the alpha 1B-2 human calcium channel subunit.
Human calcium channel subunit; diagnosis; agonist; antagonist;
Lambert Eaton syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists
Disclosure; Page 149-160; 285pp; English.
DNA encoding the alpha 1B subunit was isolated by screening a human basal ganglia cDNA library with fragments of the rabbit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 35; DB 6; Length 2237;

                                                                                                                                             NA fragment contg. pheromone-inducible yeast promoter - useful for transforming yeast cells to produce foreign proteins, which may be toxic to yeast cells.

The FUSI gene is involved in the initial zygote formation (cell surface recognition leading to cytoplasmic fusion) during conjustion. Transcription of the FUSI gene is greatly enhanced by the presence of the appropriate mating pheromone. The promoter region can be used for the pheromone inducible expression of proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 2: Page 63-77; 101pp; German.

Human neuroblastoma cell line, hippocampus, frontal and temporal cortex and visual cortex cDNA banks were screened with a probe containing carp skeletal muscle Ca-channel cDNA. The CDNA clone pR14-5.3.3.1 overlaps with clone pl24/-14.1.1.1 (see Q29563). There were a number of differences between the two sequences including the deletion of an Adenosine residue at position 1013 of pl24/-14.1.1.1 which leads to a stop codon at position 1013 of the deletion is thought to be a cloning artefact. The human neuronal calcium channel protein can be used for screening for Cachannel liquids (agonists or antagonists). See also Q29259-Q29275.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

skeletal muscle calcium channel alpha I subunit-encoding cDNA.

A portion of one of the positive clones was used to screen an IMR32 cell cDNA ilbrary. Clones that hybridised to the basal ganglia probe were used to further screen an IMR32 cell cDNA library to identify overlapping clones that in turn were used to screen a human hippocampus cDNA library. A series of clones to spream nearly the entire length of the nt. sequence encoding the human alpha is subunit was obtd. Nucleic acid amplification of specific regions of the IMR32 cell alpha IB mRNA yielded additional segments of the alpha is coling sequence. A full-length alpha is DNA clone was constructed by ligating portions of the partial cDNA clones. Nucleic acid amplification analysis of the partial cDNA clones. Nucleic acid amplification analysis of the alpha is subunit revealed an alternatively spliced alpha the alpha is subunit revealed an alternatively spliced alpha the alpha is subunit transcript to include another exon that is not present in the mRNA corresp. To the other 3' alpha is cDNA sequence that was initially isolated. The alpha is subunit encoded by a DNA sequence contg. an additional exon is referred to as alpha is and given in Q84658/R71005, whereas the other form is referred to as alpha is and given in Q84658/R71005.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnosing Lambert Eaton sydrome

Na encoding the alpha 1B subunit was tageness of the rabbit skeletal muscle calcium channel alpha 1 subunit-encoding cDNA.

A portion of one of the positive clones was used to screen an IMR32 cell cDNA library. Clones that hybridized to the basal ganglia cell cDNA prove were used to further screen an IMR32 cell cDNA library to identify overlapping clones that in turn were used to screen a chuman hippocampus cDNA library. In this way, a sufficient series of clones to span nearly the entire length of the nucleotide sequence encoding the human alpha 1B subunit was obtained. PCR amplification of specific regions of the IMR32 cell alpha 1B mRNA yielded additional segments of the alpha 1B coding sequence. A full-length alpha 1B DNA clones (see Q37817, Q37818). Alpha 1B-1 and alpha 1B subunit is a constructed by lighting options of the langual control of spatial cDNA clones (see Q37817, Q37818). Alpha 1B-1 and alpha 1B subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding specific human calcium channel sub-units - used for identifying calcium channel agonists and antagonists and

DYA BENCOGING human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists.

DYA encoding the alpha 1B subunit was isolated by screening a bisclosure; Page 138-149; 285pp; English.

DNA encoding the alpha 1B subunit was isolated by screening a contain channel alpha 1 subunit-encoding cDNA.

DNA encoding the positive clones was used to screen an IMR2 cell cDNA library clones that hybridised to the basal ganglia probe were used to further screen an IMR32 cell cDNA library. Clones that hybridised to the basal ganglia probe were used to further screen an IMR32 cell cDNA library to identify overlapping clones that in turn were used to span nearly the entire length of the nt. sequence encoding to span nearly the entire length of the nt. sequence encoding the human alpha 1B subunit was obtd. Nucleic acid amplification additional segments of the alpha 1B coding sequence. A full-length alpha 1B DNA clone was constructed by ligating portions of the partial cDNA clones. Nucleic acid amplification analysis of IMR32 cells. This second mRNA product is the alpha 1B subunit revealed an alternatively spliced alpha 1B-encoding mRNA in IMR3 cells. This second mRNA product is the cresult of differential splicing of the alpha 1B subunit transcript to include another exon that is not present in the mRNA corresp. The alpha 1B subunit encoded by a DNA sequence contg. an additional exon is referred to as alpha 1B-1 and given in Q84657/R71005, whereas the other form is referred to as alpha 1B-2 seuences are identical.

Sequence 2339 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Multi-tumour aberrant growth gene - and probes derived from it,
useful in in situ-diagnostic method for detecting tumour cells,
useful in in situ-diagnostic method for detecting tumour cells,
wesenchymal hamartchmas and rhabdomyosarcomas
Claim 6; Paqes 56-59; 78p; Brg1ish.
The present sequence is protein product of the high mobility group
(HMG) HMGI-C gene sequence (map position 12q15). Probes and
antisense sequences derived from the HMGI-C gene, a multi-tumour
aberrant growth (MAG) gene, can be useful in the in situ diagnosis
and treatment of mesenothymal hamartomas (e.g. breast or lung),
lipomas, plecomorphic salivary gland endometrial polyps,
atherosclerotic plaques and other benign tumours, as well as
malignant sarcomas (e.g. rhabdomyosarcomas and osteosarcomas) and
carcinomas (e.g. of the breast, lung, skin or thyroid). The HMGI-C
protein product, can be used for the production of antibodies for
content of hyperproliferating cells, e.g. tumour cells.
 Rat thymus 60K-CSF protein.
Rat; thymus; growth differentiation activity; thymic macrophage cell; cerebral microglial cell; cloning.
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                           DNA has an
                                                                                                                                                                                        microglial cells
Claim 2; Page 4-5; 8pp; Japanese.
The present sequence represents rat thymus 60k-CSF. The DNA has an approximate molecular weight of 60000 dalton by SDS-PAGE. The 60k-CSF protein induces the growth and differentiation of thymus macrophage cells and cerebral microglial cells. The DNA fragment can be used for cloning cDNA and genomic DNA corresponding to the
                                                                                                                                                              Thymus 60k-CSF protein DNA - encodes a protein having growth differentiation activity on thymic macrophage cells and cerebral

High mobility group protein:lipoma preferred partner fusion protein. High mobility group; lipoma preferred partner; fusion protein; DNA binding domain; HMGI-C; cysteine rich; zinc binding domain; LIM domain; translocation; tumour; mesenchymai; gene expression; Homo saplens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus
Example 5: Pages 208-209; 661pp; English.

Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV infected tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV CDNA library. The CDNA clone T00046, which encodes the proteins R81429-34 (the 6 possible reading frames), was rescued from the lambda phage, searched against a sequence database and found to be an unique HGBV sequence.

Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1..60

Wilti-tumour aberrant growth gene - and probes derived from it, useful in in situ diagnostic method for detecting tumour cells, e.g. mesenchymal hamartonas and rhabdomyosarcomas

Example 3; Pages 45-47; 78pp; English.

Example 3; Pages 45-47; 78pp; English.

Example 3; Pages 45-47; 78pp; English.

The present sequence is the predicted protein product of a 3'-RACE product, comprising the junction region of a high mobility group protein (HMG):lipoma preferred partner (LPP) fusion gene. The product was predicted to contain 3 DNA binding domains of the LPP (map position and the 3 cysteine rich clinding (LMM) domains of the LPP (map position arious primary lipomas on the phybrid transcripts were detected in various primary lipomas and lipoma cell lines carrying a chromosome 3 to 12 translocation (4(3;12)), and in a cytogenetically normal lipoma. This revealed that the cytogenetically detectable, and hidden, t(3;12) in lipomas cell in the in-phase fusion of the DBD of HMGI-C to the LIM consented in the nuclear environment of these lipoma cells, where presented in the nuclear environment of these lipoma cells, where they might affect gene expression, possibly leading to aberrant growth control. This in an example of a benign mesenchymal tumour the formation of a well-defined tumour associated HMGI-C fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Claim 1; Pages 16-20; 23pp; German.
The present sequence is maize starch synthase type I, useful in the production of starch. Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

SUBMITTED (MAR-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

-!- FUNCTION: CYTCCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGENASES. THEY OXIDIZE A VARIETY OF STRUCTURALLY UNRELATED
COMPOUNDS, INCLUDING STERCIDE, FATTY ACIDS, AND XENOBIOTICS.

-!- SIMILARITY: BELONGS TO THE CYTCCHROME P450 FAMILY.

-I- FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGENASES. THEY OXIDIZE A VARIETY OF STRUCTURALLY UNRELATED
COMPOUNDS, INCLUDING STEROIDS, FATTY ACIDS, AND XENOBIOTICS.

-I- SIMILARIYY: BELONGS TO THE CYTOCHROME P450 FAMILY.
EMBL; 248717; G732595; -

A HWANG G.-Y., CHIOU J.-F., YANG Y.-Y., LI J.K.-K.;

VIRUS RES. 24:315-323(1992).

-!- FUNCTION: SURROUNDS AND INTERACTS WITH THE GENOMIC DS-RNA.

POSSESSES SS- AND DS-RNA-BINDING CAPACITY. ITS HYDROPHILIC

NATURE AND CAPABILITY TO BIND SS- AND DS-RNA SUGGEST ITS

INTERACTIONS WITH BTY CENOMIC RNA.

-!- SUBCELLULAR LOCATION: INNER CAPSID.

C -!- CAUTION: SEE ALSO VERSION I OF THIS PROTEIN.

J. BACTERIOL. 175:2936-2942(1993).

-!- CATALYTIC ACTIVITY: ATP + L-GLUTAMATE + TRNA(GLU) = AMP +
PYROPHOSPHATE + L-GLUTAMYL-TRNA(GLU).

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: CYTOPLASMIC.

-!- SIMILARITY: BELONGS TO CLASS-I AMINOACYL-TRNA SYNTHETASE FAMILY.

PRIS; A35999; A36999.

PROSITE; PS00178; AA_TRNA_LIGASE_I; 1.

AMINOACYL-TRNA SYNTHETASE; PROPERN BIOSYNTHESIS; LIGASE; ATP-BINDING.

BLACHERE C;
SUBMITTED (JAN-1994) TO EMBL/GENBANK/DDBJ DATA BANKS.

-!- FUNCTION: SURROUNDS AND INTERACTS WITH THE GENOMIC DS-RNA.

POSSESSES SS- AND DS-RNA-BINDING CAPACITY. ITS HYDROPHILIC
NATURE AND CAPABILITY TO BIND SS- AND DS-RNA SUGGEST ITS
INTERACTIONS WITH BTV GENOMIC RNA.

C:- SUBCELLULAR LOCATION: INNER CAPSID.

C:- CAUTION: SEE ALSO VERSION 2 OF THIS PROTEIN.

```
DNA encoding protein with agarase activity - useful for the industrial production of a large amount of monagaral production of a large amount of monagaral production of a large amount of monagaral production of a large amount of claim 1; Page 8-12; 13pp; Japanese.

The sequence of a novel protein containing agarase activity from acids. The gene was obtained by PCR amplification from a Vibrio genomic acids. The gene was obtained by PCR amplification from a Vibrio genomic library using primers and probes based on the amino acid sequence (R60813-21) from protein sequencing of partially degraded agarase 0107. The gene was then introduced into E.coli JM83. The expressed protein could then be recovered by cation-exchange chromatography. The protein can be used in the large scale manufacture of neoagarooligosaccharide.
                                                     20-JUL-1995 (first entry)
Agarase 0107 from Vibrio species.
Agarase; Vibrio: PCR; amplification; amplify; primer; probe; E.coll;
Cation-exchange; chromatograph; neoagarooligosaccharide.
Vibrio sp. JT0107.

This amino acid sequence is a cytotoxic Epstein Barr virus (EBV) T-cell epitope of the EBV nuclear antigen 3A (EBNA3A), which binds the human elukocyte antigen acceptor All (HLA All). It is used to prepare a vaccine which may include the cytotoxic EBV T-cell epitope (W40828 W40846), or a nucleic acid sequence encoding it. The vaccine produced comprises or encode at least one antigen (W40847-W40876) to which the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytocoxic Epstein-Barr T-cell epitope 37.

Cytocoxic Epstein-Barr T-cell epitope 37.

Herpes simplex virus type 4; Epstein-Barr virus; EBV; cytotoxic;

T-cell epitope; nuclear antigen; human leukocyte antigen; HLA; vaccine; tetanus toxoid; diphtheria toxoid; Bordetella pertussis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         individual will mount an anamnestic response, e.g. a tetanus toxoid, diphtheria toxoid, Bordetella pertussis antigen, poliovirus antigen, purified protein derivative, glycoprotein 350 protein, and/or helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         beta-1,4-galactosyltransferase-related proteins. These proteins can be used as diagnostic agents for various diseases. They are esp. useful in the diagnosis of sterility and in the aiding and inhibiting of fertilisation. The CDNA's encoding the two beta-1,4-galactosyltransferase-related proteins were isolated from F9 cancer cells according to Huynh's method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mature protein sequence. The fragments are portions of the extracellular domain of the protein and contain a heparam sulphate glycosaminoglycan attachment site (R66795). The functional domains, esp. the soluble extracellular or heparam binding site, of the syndecan molecules (see R65797-812 and R68818) can be used to construct chimaeras by linking them to biological effector molecules, cell surface receptors, drugs, antibodies, diagnostic agents or components of microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-SEP-1995 (first entry)
N-terminal fragment (a.a. 1-154) of mature mouse syndecan-1.
Cell surface: proteoglycan; syndecan; mouse; mammary; epithelial cell; ectodomain; NMuMG, glycosylation; heparan sulphate; chondroitin sulphate; glycosaminoglycan; chimaera; chimaeric molecule; effector molecule; receptor; drug; antibody; diagnostic agent.
Mus musculus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11-SEP-1995 (first entry)
N-terminal fragment (a.a. 1-84) of mature mouse syndecan-1.
Cell surface; proteoglycan; syndecan; mouse; mammary; epithelial cell; ectodomain; NMLMG; glycosylation; heparan sulphate; chondroitin sulphate; glycosaminoglycan; chimaera; chimaeric molecule; effector molecule;
                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Proteoglycans - comprising a core protein having glycosylation

Proteoglycans - comprising a core protein having glycosylation

Sites for heparin sulphate glycosaminoglycan side chains.

Claim 15; Page 81; 97pp; English.

Peptides R66797-802 correspond to varying length fragments of the

N terminal sequence of the mature mouse syndecan-1 (see R66793 and

R66796). The sequence given here covers the amino acids from 1-188 of the

Cmature protein sequence. The fragments are portions of the extracellular

domain of the protein and contain a heparan sulphate glycosaminoglycan

attachment site (R66795). The functional domains, esp. the soluble

extracellular or heparan binding site, of the syndecan molecules (see

R66797-812 and R66818) can be used to construct chimaeras by linking them

contained to biological effector molecules, cell surface receptors, drugs,

antibodies, diagnostic agents or components of microorganisms.
          proteoglycans - comprising a core protein having glycosylation sites for heparin sulphate glycosaminoglycan side chains. Claim 15: Page 82: 97pp; English.

Peptides R66/97-802 correspond to varying length fragments of the Peptides R66/97-802 correspond to varying length fragments of the mature protein sequence of the mature mouse syndecan-1 (see R66/93 and R66/96). The sequence of the mature covers the amino acids from 1-154 of the mature protein sequence. The fragments are portions of the extracellular domain of the protein and contain a heparam sulphate glycosaminoglycan attachment site (R66/95). The functional domains, esp. the soluble extracellular or heparam binding site, of the syndecan molecules (see R6797-812 and R66818) can be used to construct chimeras by linking them to biological effector molecules, cell surface receptors, drugs, antibodies, diagnostic agents or components of microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11-SEP-1995 (first entry)
N-terminal fragment (a.a. 1-188) of mature mouse syndecan-1.

DNA and protein sequences for recombinant syndecan-derived protein protein a comprising a core protein having glycosylation sites for heparin sulphate glycosyminoglycan sides chains.

Claim 22: Page 83: 97pp: English.

Peptides R66803-810 correspond to the extracellular domains of the mouse syndecans 1-4 or fragments of these domains. The sequence given here represents amino acids 1-228, thus covering the entire extracellular domain, of the mature mouse syndecan-1 protein (see R66793 and R66796). The peptides presented all contain a heparam sulphate glycosaminoglycan attachment site (see R66794). The functional domains, esp. the soluble extracellular or heparam binding site, of the syndecan molecules (see R66797-812 and R66818) can be used to construct chimaeras by linking them to biological effector molecules, cell surface receptors, drugs, antibodies, diagnostic agents or components of microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA and protein sequences for recombinant syndecan-derived proteoglycans - comprising a core protein having glycosylation sites for heparin sulphate glycosaminoglycan side chains. Claim 13; Page 81; 97pp; English.

The sequence of the mature cell surface proteoglycan - syndecan-1. The corresponding gene (081748) was isolated from a mouse mammary epithelial cell cDNA library in lambda gill using rabbit antisera against the ectodomain of NMuMG mouse mammary epithelial cell syndecan-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell surface; proteoglycan; syndecan; mouse; mammary; epithelial cell; cetodomain; NMMMG; glycosylation; heparan sulphate; chondroitin sulphate; chimaera; chimaeric molecule; effector molecule; receptor; drug; antibody; diagnostic agent.

comprising; (1) a hydrophilic N terminal extracellular domain (residues 23-252); (2) a hydrophilic N terminal extracellular domain (residues 253-277) and (2 3 a hydrophilic Terminal intracellular domain (residues 253-277) and (3) a hydrophilic C-terminal intracellular domain (residues 278-331). (C 4) a hydrophilic C-terminal intracellular domain (residues 278-331). (C 5) a protein contains a protease susceptible cleavage sequence (C 5) and adjacent to the transmembrane region and at least one (C 6) subjects of the extracellular region. The syndecan 1 protein is thought to contain a 22 amino acid signal peptide, lacking in this sequence, but (C 6) this was unresolved due to N-terminal blocking of the mature peptide, however a likely site for signal peptidase cleavage occurs after Pro-22. (C 7 the functional domains, esp. the soluble extracellular or heparan binding site, of the syndecan molecules (see R66797-812 and R66818) can be used (C c contain surface receptors, drugs, antibodies, diagnostic agents or construct chimaeras by linking them to biological effector molecules, (C components of microorganisms.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the mouse syndecan protein sequence. A 350 base pair fragment
(15947) the mouse syndecan protein sequence. A 350 base pair fragment
(15948) of a purified 2196 base pair DNA molecule (15947) enhances
the expression of a gene operably linked to the promoter of the mouse
syndecan gene in 373 cells following treatment with TGF- beta and brGF
when the fragment is operably linked to the promoter. A purified DNA
molecule comprising a portion of the nucleotide residues 3538-3888 of
the mouse syndecan genomic sequence suppresses expression of a gene
coperably linked to the promoter of the mouse syndecan gene in S115 cells
treated with testosterone. Host cells can be transfected with vectors
which contain either the enhancing or suppressing DNA molecules. The
products may be used to alter the differentiated state of a host cell by
altering its expression of syndecan, e.g. to induce and regulate syndecan
expression, especially in cells which exhibit a malignant phenotype,
regardless of the origin of transformation. The products can be used to
produce therapeutics for suppressing tumour growth. They may enhance the
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mouse syndecan gene sequences - useful for, e.g. suppressing tumour growth or promoting tissue regeneration in processes such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse syndecan protein sequence.

Proteoglycans - comprising a core protein having glycosylation proteoglycans - comprising a core protein having glycosylation sites for heparin sulphate glycosaminoglycan side chains.

Claim 13: Page 80: 97pp; English.

Claim 13: Page 80: 97pp; English.

The sequence of the novel cell surface proteoglycan - syndecan-1. The corresponding gene was isolated from a mouse mammary epithelial cell cDNA clarary in lambda gill using rabbit antisera against the ectodomain of NAUMG mouse mammary epithelial cell syndecan-1. The complete sequence of the gene encodes a protein of 30-35 kD comprising; (1) a hydrophilic C N-terminal extracellular domain (residues 23-252); (2) a hydrophilic C transmembrane domain (residues 23-277) and (3) a hydrophilic C-terminal contains a protease susceptible cleavage sequence extracellularly and adjacent to the cansomedrane region and at least one glycosylation site (residues 45-48) corresponded but this was unresolved due to N-terminal blocking of the mature peptide but this was unresolved due to N-terminal blocking of the mature peptide, however a likely site for signal peptidase cleavage occurs after Pro-22. The functional domains, esp. the soluble extracellular or beparan blocking of the syndecan molecules (see R66797-812 and R6818) can be used to construct chimaeras by linking them the stracellular or second secon
                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel mouse profeoglycan syndecan-1 protein sequence.

chimaera; chimaeric molecule; effector molecule; receptor; drug;
antibody; diagnostic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R66818) can be used to construct chimaeras by linking them to biological effector molecules, cell surface receptors, drugs, antibodies, diagnostic
                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
syndecan expression in a host cell, by enhancing its gene transcription, especially in malignant or normal cells, and therefore promote tissue regeneration, especially in processes such as wound healing.
                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Disclosure; Fig 2; 49pp; English.

Mouse syndecan-1 (R87001) is a cell surface proteoglycan. Its ectodomain is capable of normalising the growth rate and differentiation state of mailgnant cells. By providing the ectodomain to a cell's extracellular environment, tumours characterised by a loss of syndecan-1 can be treated. Expression of the ectodomain in transfected S115 cells normalised malignant growth of the cells. The ectodomain was also demonstrated to suppress tumour in vivo growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Syndecan stimulation of cellular differentiation - useful for decreasing tumour growth used to promote hair growth bisclosure; page 22.39; 65pp; English.

The mouse syndecan gene enhancer, located 8-10 kb upstream from the initiation site, is given in Q67901. Manipulation of the enhancer can be used either to slow or prevent tumor growth or to promote differentiation of specific cell types, e.g. epidermal cells to promote hair formation. The complete mouse syndecan gene and its encoded protein are given in Q67902 and R55276.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                            Syndecan protein.

27-APR-1998 (first entry)
Antigenic decapeptide derived from the human Sp17 protein.
Sp17; sperm autoantigen; antigen; antigenic epitope; fertility;
immunocontraception; immunocontraceptive vaccine; autoimmune fertility.
                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immuno:contraceptive to reduce fertility
Example 14; Page 96; 160pp; English.
Peptides W42726-58 are a series of N-terminal acetylated sequential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 1; Fig 2; 40pp; English.

A 105.4 kDa alpha-glucosidase (W18580) is encoded by an isolated nucleic acid (T69925) of potato cv. Record. This isolated nucleic acid can be used to modify alpha-glucosidase activity in plants or transformed microorganisms. Activity is enhanced through the use of sense nucleic acids, thereby providing more efficient breakdown of starch (useful in malting and brewing), novel starches, or enhanced flavour to plant tissues such as fruit. Inhibition of alpha-glucosidase activity through the use of antisense sequences can inhibit starch breakdown and to control pre-sprouting and dry sequence 919 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sense and antisense plant alpha-glucosidase nucleic acids - useful for modifying alpha-glucosidase activity, e.g. for enhancing plant tissue flavour, producing novel starch, to control pre-sprouting,

Sperm protein Spl7 antigenic peptide(s) - used as immuno-contraceptive to reduce fertility.

Example 25; Table 5; 160pp; English.

Example 25; Table 5; 160pp; English.

Co fragments of the human Spl7 protein. Each decapeptide is shifted along the Spl7 sequence between amino acids W42800-820 are derived from the human Spl7 sequence between amino acids 40-80 inclusive, while W42849-67 are between amino acids 114-149 inclusive. The peptides contain antigenic epitopes in mice, rabbits, non-human primates and humans. They induce antibodies which recognise sperm, and inhibit fertilisation. The peptides can be used in immunocontraceptive methods as a immunocontraceptive vaccine to reduce the fertility of animals, particularly in females. The presence of the antigenic peptides can be detected to diagnose autoimmune fertility in both male and female subjects.
                                                                                                                                                                                                                                                                                 ö
               Mimotope analysis was performed using the peptide pinblock method.
Peptides comprising a contiguous segment of the amino acids of Sp17
have been found to be antigenic. They induce antibodies which recognise sperm, and inhibit fertilisation. The peptides can be used in immunocontraceptive methods as a immunocontraceptive vaccine to reduce the fertility of animals, particularly in females. The presence of the antigenic peptides can be detected to diagnose autoimmune fertility in both male and female subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antigenic decapeptide derived from the human Sp17 protein. Sp17: sperm autoantigen; antigen; antigenic epitope; fertility; immunocontraception; immunocontraceptive vaccine; autoimmune fertility.
                                                                                                                                                                                                                                                                               Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 17.595; Variance 16.811; scale 1.047 Statistics:

SUMMARIES

HUM. MUTAT. 10:248-250(1997).

CHOTION: STIMULATES THE GTPASE ACTIVITY OF RAS. NF1 SHOWS GREATER AFETURITY FOR RAS GAP, BUT LOWER SPECIFIC ACTIVITY. THUS IT MAY BE A REGULATOR OF RAS ACTIVITY.

A REGULATOR OF RAS ACTIVITY.

CHOTISASSES THIS PROTEIN IS ASSOCIATED WITH TYPE 1 NEUROFIBROMATOSIS (NRI) (ALSO CALLED VON RECKLINGRAUSEN SYNDROME), THE MOST FREQUENT INHERITED GENETIC DISEASE (ABOUT 1 IN 3000). IT EXHIBITS FULL PREPRESENTING A NEW MUTATION RATE WITH 30 TO 50% OF NPI PATIENYS REPRESENTING A NEW MUTATION RATE WITH 30 TO 50% OF NPI PATIENYS REPRESENTING A NEW MUTATION (CAFE-AU-LAIT SPOTS), LISCH NOULES OF THE IRIS PERIPHERAL, PERIPHERAL NERVOUS SYSTEM ASSOCIATED TUMORS AND FIBROMATOUS SKIN TUMORS. THE DISEASE DEMONSTRATES A HIGH DEGREE OF PENETRANCE BY AGE 5 YEARS.

CHOTISASSES DEFECTS IN NEI ARE ASSOCIATED WITH WATSON SYNDROME (WS).

WE IS CHARACTERIZED BY THE PRESENCE OF PULMONARY STENOSIS, CAFE-AU-LAIT SPOTS, AND MENTAL RETARRATION. WS IS CONSIDERED AS AN ATYPICAL FORM OF NFI. ARE ASSOCIATED WITH LEOPARD, AN AUTOSOWAL DOMINANT SYNDROME. LEDOPARD (LS) IS AN ACRONYM FOR THE FEATURES OF THIS SYNDROME. LEDOPARD (LS) IS AN ACRONYM FOR THE FEATURES OF THIS SYNDROME. MATURE 347:291-294(1990).

LIEUTORION: STIMULATES THE GTPASE ACTIVITY OF RAS. NFI SHOWS GREATER AFFINITY FOR RAS GAP, BUT LOWER SPECIFIC ACTIVITY. THUS IT MAY BE

A REGULATOR OF RAS ACTIVITY.

LITISSUE SPECIFICITY: TYPE I IS EXPRESSED PREDOMINANTLY IN BRAIN, STINAL CORD AND TESTIS. TYPE II IS EXPRESSED PREDOMINANTLY IN ADRENAL GLAND, AND TYPE IV IS EXPRESSED

MAINLY IN THE TESTIS.

LIT AND IV) ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GRAE. THE SEQUENCE SHOW HERE IS THAT OF TYPE II.

CHATERNATIVE SEQUENCE SHOW HERE IS THAT OF TYPE II.

A DESGROSEILERS L., AUCLAIR D., WICKHAM L.;

MEDLINE; 90301499.

DESGROSEILERS L., AUCLAIR D., WICKHAM L.;

NUCLETC ACIDS RES. 18:3654.3564(1990).

-1- FUNCTION: ACTINS ARE HIGHLY CONSENVED PROTEINS THAT ARE INVOLVED
IN VARIOUS TYPES OF CELL MOTILITY AND ARE UBIQUITOUSLY EXPRESSED
IN ALL EUKARYOTIC CELLS.

-1- FUNCTION: MULTIPLE ISOFONMS ARE INVOLVED IN VARIOUS CELLULAR
FUNCTIONS SUCH AS CYTOSKELETON STRUCTURE, CELL MOBILITY,

CHROMOSOME MOVEMENT AND MUSCLE CONTRACTION.

-1- SUBBUILT: POLYMERIZATION OF GLOBULAR ACTIN (G-ACTIN) LEADS TO A
STRUCTURAL FILLAMENT (F-ACTIN) IN THE FORM OF A TWO-STRANDED
HELLY. EACH ACTIN CAN BIND TO 4 OTHERS.

-1- SUBCELLULAR LOCATION: CYTOPLASMIC.

-1- SUBCELLULAR LOCATION: CYTOPLASMIC.

-1- SUBCELLULAR SABOMINAL GANGLIONS.

This protein contains a GPress-activating protein-related domain
which is responsible for the stimulatory effect of neurofibromin
on the tyrosinase promoter activity.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
